EVAL BOARD USER'S MANUAL

INTRODUCTION

Purpose

This manual provides detailed information about the configuration and use of the RSL10 Evaluation and Development Board (RSL10-002GEVB). The Evaluation and Development Board is designed to be used with the software development tools to evaluate the performance and capabilities of the RSL10 radio System-on-Chip (SoC).

Manual Organization

The *Evaluation and Development Board Manual* contains the following chapters and appendices:

- **Chapter 1: Introduction** describes the purpose of this manual, describes the target reader, explains how the book is organized, and provides a list of suggested reading for more information.
- **Chapter 2: Overview** provides an overview of the Evaluation and Development Board described in this manual.
- **Chapter 3: Evaluation and Development Board** provides the details of the Evaluation and Development Board. The chapter is divided into the following topics:
 - ◆ Development Board Setup
 - ◆ Development Board Design
 - ◆ Power Supply
 - ◆ Level Translators
 - ◆ LED Circuitry
 - ◆ RSL10 SoC
 - ◆ Measuring the Current Consumption
 - ◆ SWJ-DP Debug Port
 - ◆ Digital Input/Output (DIO)
 - ◆ Power Supply and Test Points
- **Appendix A: Connectors** provides a complete list of the connectors and jumpers on the Evaluation and Development Board.
- **Appendix B: Schematics** contains the schematics for the Evaluation and Development Board.
- **Appendix C: Bill of Materials** contains a list of the parts that are used to manufacture the Evaluation and Development Board.

Further Reading

For more information, refer to the following documents:

- *Getting Started with RSL10*
- *RSL10 Firmware Reference*

- *RSL10 Hardware Reference*
- RSL10 Datasheet

OVERVIEW

Introduction

The RSL10 Evaluation and Development Board is used for evaluating the RSL10 SoC and for application development. The board provides access to all input and output connections via 0.1" standard headers. The on-board communication interface circuit provides communication to the board from a host PC. The communication interface translates RSL10 SWJ-DP debug port signals to the USB of the host PC. There is also an on-board 4-bit level shifter for debugging; it translates the I/O signal level of RSL10 to the 3.3 V digital logic level. It is not enabled by default; you enable it when it is needed.

Evaluation and Development Board Features

The Evaluation and Development Board enables developers to evaluate the performance and capabilities of the RSL10 radio SoC in addition to developing, demonstrating and debugging applications.

Key features of the board include:

- J-Link onboard solution provides a SWJ-DP (serial-wire and/or JTAG) interface that enables you to debug the board via a USB connection with the PC
- Alternate onboard SWJ-DP (serial-wire and/or JTAG) interface for Arm® Cortex®-M3 processor debugging
- Access to all RSL10 peripherals via standard 0.1" headers
- Onboard 4-bit level translator to translate the LPDSP32 debug interface at low voltage to a 3.3 V JTAG debugger
- Antenna matching and filtering network
- Integrated PCB antenna
- Compliance with the Arduino form factor
- Support for PMOD (i.e., J4 is a standard connector)

EVALUATION AND DEVELOPMENT BOARD

Evaluation and Development Board Setup

This section is an overview of how to configure the Evaluation and Development Board. Details of the

development board configuration are discussed later in this manual.

Figure 1 represents an overview of the board setup.

Figure 1. Evaluation and Development Board Setup

If you want to use an external J-Link debugger instead of the onboard one, connect the debugger to connector P2 on

the QFN board, as shown in Figure 2. Notice that for this setup, you also need a power supply.

Figure 2. Evaluation and Development Board Setup with External J-Link Debugger

Evaluation and Development Board Design

The following sections detail the various sub-circuits of the RSL10 Evaluation and Development Board. The block

diagram in Figure 3 shows the locations of the various circuit sections. Figure 5 and Figure 6 provide 3-dimensional illustrations of the QFN board.

Figure 3. Circuit Location Block Diagram (Top View)

Figure 4. Circuit Location Block Diagram (Bottom View)

Figure 5. Three-Dimensional Line Drawing of the Board (Top View)

Figure 6. Three-Dimensional Line Drawing of the Board (Bottom View)

Power Supply

The Evaluation and Development Board can be powered by one of the following:

- Micro USB port with regulator
- External power supply connector (P5) with regulator

- External power supply connector (P5) without regulator

Use the jumpers on pin headers P4, P7 and P10 to select a power supply option as show in Table 1.

Table 1. POWER SUPPLY SELECTION

Power Source	Jumper Position on P4	Jumper Position on P7	Jumper Position on P10
Micro USB Port with Regulator	1&2	2&3	1&2
External Power Supply with Regulator	3&4	2&3	1&2
External Power Supply without Regulator	5&6	2&3	2&3

Table 2. MINIMUM/MAXIMUM EXTERNAL REGULATED VOLTAGES

Power Supply	Header	Input Voltage		
		Minimum	Typical	Maximum
RSL10 and J-Link OB MCU	EXT-PSU Regulated	3.3 V	3.6 V	12.0 V
RSL10 and J-Link OB MCU	USB	–	5.0 V	–
RSL10	EXT-PSU Unregulated	1.1 V	1.25 V	3.6 V

Level Translators

The board has level translators for the DIO signals of RSL10, including the clock signal. The level translators facilitate interfacing to external devices that operate at a higher voltage than RSL10.

VDDO and 3.3 V are two different power rails. The translator allows a logic signal on the VDDO side to be translated to either a higher or a lower logic signal voltage on the 3.3 V side, and vice-versa.

The level translation circuitry consists of components U4 and the 2x4 header. Signals are translated from the VDDO voltage reference to 3.3 V (default) voltage provided by the regulator output or by an external supply. The VDDO voltage is configured by the pin on header P11 (located on the board edge) to either VBAT_DUT, 3.3 V or other level within the VDDO voltage range, which is 1.1 to 3.3 V.

The NLSX5014 level translators are bi-directional. They have the following features:

- Wide voltage operating range: 0.9 V to 4.5 V
- VDDO and 3.3 V are independent
- VDDO can be equal to, or less than, 3.3 V when connected to the power rail

To enable the level translators, populate positions R34 and R35 with 0 ohms. By default, the level translators are disabled. NOTE: Enabling the level translator affects power consumption.

LED Circuitry

There are two LEDs on the board. One is a dual color LED, called LD1, connected to the J-Link emulator

microcontroller unit (MCU). The other is the green LED, connected to DIO 6 of RSL10. You can use this LED within your applications as an indication LED by programming DIO 6. If DIO 6 is high, this LED is on.

Measuring the Current Consumption

This section deals with measuring current consumption for the Evaluation and Development Board.

Headers are provided for each of the regulated voltages for additional capacitance and/or for measurements. RSL10 has 16 digital I/Os. The VDDO pin in header P9 configures the I/O voltages for power domains to VBAT. The VBAT pin in header P10 configures the VBAT source. The power select pin in header P4 configures the power source of the RSL10. In addition the measurements should be done by connecting an ammeter to current measure header P3 to measure the device power consumption in isolation.

To measure the current consumption of RSL10 only, you need to source the chip using the external power supply without the regulator as shown in Table 2. To remove leakage currents during current measurement, remove the jumpers on header SWD. Removing the jumpers between the MCU and RSL10 that connect nRESET, SWDIO and SWCLK prevents current leakage from the JTAG interface, avoiding inaccurate current measurements. In addition, DIOs 4, 5 and 6 must be configured to High-Z (disabled) with no pull up in software. DIOs 4 and 5 are directly connected to the Atmel chip and will leak power into it. DIO 6 is directly connected to the transistor driving the LED and can leak power into it.

SWJ-DP DEBUG Port

The J-Link adapters are typically used to communicate with RSL10 using the standard Coresight SWJ-DP debug port in a JTAG/SW communication protocol. The 9-pin 0.05 in Samtec FTSH header (P1), defined by the Arm Cortex-M3 core on the board, connects RSL10 to external adapters compatible with the Arm Cortex-M3 processor's SWJ-DP interface. Alternatively, you can connect the micro USB port on the board to a PC.

DIGITAL Input/Output (DIO)

RSL10 contains 16 digital I/O (DIO) signals. The DIO voltage domain is VDDO, while the input voltage can be VBAT or external voltage as outlined in Section “Measuring the Current Consumption” on page 7.

The DIO signals on RSL10 are multiplexed with several interfaces, including:

- One I²C interface (DIO [7:8])
- Four external inputs to the low-speed analog to digital converters (DIO [0:3])
- One PCM interface
- Two PWM drivers
- Two SPI interfaces (DIO [13:15])
- One UART interface (DIO [4:5])
- Support interfaces that can be used to monitor control of the RF front-end and Bluetooth® baseband controller

For more information about the DIO multiplexed signals, refer to the *RSL10 Hardware Reference*.

The board provides access to any of the DIOs or their multiplexed signals via the Arduino Headers (Power1, AD1, IOL1, and IOH1).

The LED circuit provides visual monitoring of the DIOs; refer to Section “LED Circuitry” on page 7 for further information.

Power Supplies

There are several external power supplies available on your Evaluation and Development Board.

The user can also access signals on various headers on boards, as described throughout this document.

The external power supplies available for QFN boards are:

- VBUS, 5 V from USB connection – available only when USB is plugged in
- V3.3, 3.3 V from LDO – available when regulated supply is selected
- VEXT, (P5 header) unregulated external supply – available when unregulated supply is selected
- Battery (J5 Battery Holder, 12 mm coin cell battery)

APPENDIX A – CONNECTORS

Overview

This appendix lists all connectors on the Evaluation and Development Board. The sections that follow provide descriptions for:

- Jumpers and their possible configurations
- Headers
- Switches and their possible configurations
- Connectors

Configuration Header Jumpers

Table 3. JUMPER DESCRIPTIONS

Designator	Description
P4	Regulated or Unregulated power supply selection
P10	VBAT Power Source selection (3.3 V, Vext or Battery)
P9	VDDO selection (VBAT_DUT, 3.3 V)
P8	VDD_AT selection (3.3 V, VDDO)
P1	Onboard JTAG debugger connection

Headers

Table 4. HEADER DESCRIPTIONS

Designator	Description
POWER1	Arduino Power header 3.3 V, VDDO, nRESET, GND
AD1	Arduino Analog Inputs header A [0:3]
IOL1	Arduino IOL header UART, INT [0:1], SPI2
IOH1	Arduino IOH header I2C, SPI1
P2	External JTAG debug connection header
P3	Current measurement header
P5	External power supply header
P6	Input and output of level shifter

Switches

Table 5. SWITCH DESCRIPTIONS

Designator	Description
SW1	Pushbutton switch to reset RSL10
SW2	Pushbutton switch for DIO5

Connectors

Table 6. CONNECTOR DESCRIPTIONS

Designator	Description
J1	RF switch connector
J2	Micro USB port for power supply, JTAG and UART emulation
J3	MCU programming connector
J4	Digilent PMOD peripheral connector I2C, SPI1, INT0
J5	Battery Holder (12 mm coin cell)

APPENDIX B – SCHEMATICS

This appendix contains schematics for the Evaluation and Development Board, version 1.3:

- The Top-level (Arduino interface) schematic
- The RSL10 schematic
- The Interface MCU schematic
- The Power Supply schematic

Figure 9. Interface MCU Schematic

ON Semiconductor owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of ON Semiconductor's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.

The evaluation board/kit (research and development board/kit) (hereinafter the "board") is not a finished product and is as such not available for sale to consumers. The board is only intended for research, development, demonstration and evaluation purposes and should as such only be used in laboratory/development areas by persons with an engineering/technical training and familiar with the risks associated with handling electrical/mechanical components, systems and subsystems. This person assumes full responsibility/liability for proper and safe handling. Any other use, resale or redistribution for any other purpose is strictly prohibited.

The board is delivered "AS IS" and without warranty of any kind including, but not limited to, that the board is production-worthy, that the functions contained in the board will meet your requirements, or that the operation of the board will be uninterrupted or error free. ON Semiconductor expressly disclaims all warranties, express, implied or otherwise, including without limitation, warranties of fitness for a particular purpose and non-infringement of intellectual property rights.

ON Semiconductor reserves the right to make changes without further notice to any board.

You are responsible for determining whether the board will be suitable for your intended use or application or will achieve your intended results. Prior to using or distributing any systems that have been evaluated, designed or tested using the board, you agree to test and validate your design to confirm the functionality for your application. Any technical, applications or design information or advice, quality characterization, reliability data or other services provided by ON Semiconductor shall not constitute any representation or warranty by ON Semiconductor, and no additional obligations or liabilities shall arise from ON Semiconductor having provided such information or services.

The boards are not designed, intended, or authorized for use in life support systems, or any FDA Class 3 medical devices or medical devices with a similar or equivalent classification in a foreign jurisdiction, or any devices intended for implantation in the human body. Should you purchase or use the board for any such unintended or unauthorized application, you shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the board.

This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and may not meet the technical requirements of these or other related directives.

FCC WARNING – This evaluation board/kit is intended for use for engineering development, demonstration, or evaluation purposes only and is not considered by ON Semiconductor to be a finished end product fit for general consumer use. It may generate, use, or radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment may cause interference with radio communications, in which case the user shall be responsible, at its expense, to take whatever measures may be required to correct this interference.

ON Semiconductor does not convey any license under its patent rights nor the rights of others.

LIMITATIONS OF LIABILITY: ON Semiconductor shall not be liable for any special, consequential, incidental, indirect or punitive damages, including, but not limited to the costs of requalification, delay, loss of profits or goodwill, arising out of or in connection with the board, even if ON Semiconductor is advised of the possibility of such damages. In no event shall ON Semiconductor's aggregate liability from any obligation arising out of or in connection with the board, under any theory of liability, exceed the purchase price paid for the board, if any.
