

Joystick 3 Click

PID: MIKROE-5378

Joystick 3 Click is a compact add-on board that can fulfill your directional analog input needs. This board features [2765](#), a high-quality mini 2-axis analog output thumbstick from Adafruit Industries. This small joystick is a 'self-centering' analog-type with a black rocker cap similar to the PSP joysticks. It comprises two 10kΩ potentiometers, one for up/down and another for left/right direction. Knowing that this joystick represents an analog type, it connects with mikroBUS™ through the SPI interface through the MCP3204 12-bit A/D converter. This Click board™ is suitable for numerous applications as a human-machine interface device (HMI), robotics, and other control interfaces.

Joystick 3 Click is supported by a [mikroSDK](#) compliant library, which includes functions that simplify software development. This [Click board™](#) comes as a fully tested product, ready to be used on a system equipped with the [mikroBUS™](#) socket.

How does it work?

Joystick 3 Click, as its foundation, uses 2765, a high-quality mini 2-axis analog-type thumbstick from Adafruit Industries. This type of joystick has a self-centering feature that allows it to center itself the moment when you release the joystick. It also contains a comfortable cup-type black knob/cap, which gives the feel of a thumbstick, making it very similar to the 'analog' joysticks on PSP joysticks, suitable for numerous applications as a human-machine interface.

Mikroe produces entire development toolchains for all major microcontroller architectures.

Committed to excellency, we are dedicated to helping engineers bring the project development up to speed and achieve outstanding results.

ISO 27001: 2013 certification of informational security management system.
 ISO 14001: 2015 certification of environmental management system.
 OHSAS 18001: 2008 certification of occupational health and safety management system.

ISO 9001: 2015 certification of quality management system (QMS).

It comprises two 10kΩ potentiometers, one for up/down and another for left/right direction, used as dual adjustable voltage dividers providing 2-axis analog input in a control stick form. With the joystick fully assembled and functioning, the voltage will follow the motion of the thumbstick as it is moved around.

The measurements of the potentiometer resistance change are needed to read the joystick's physical position. That's why the [MCP3204](#), a 12-bit A/D converter from Microchip, connects the joystick with mikroBUS™ using a simple serial interface compatible with the SPI protocol to determine the value of the joystick's X and Y. As the MCP3204 has a resolution of 12 bits, the values on each analog channel (axis) can vary from 0 to 4095. So, if the stick is moved on the X axis from one end to the other, the X values will change from 0 to 4095, and a similar thing happens when moved along the Y axis. The value of the joystick staying in its center position is around 2048. Also, the MCP3204 is capable of conversion rates of up to 100kps.

This Click board™ can be operated only with a 3.3V logic voltage level. The board must perform appropriate logic voltage level conversion before using MCUs with different logic levels. However, the Click board™ comes equipped with a library containing functions and an example code that can be used, as a reference, for further development.

Specifications

Type	Pushbutton/Switches
Applications	Can be used for numerous applications as a human-machine interface device (HMI), robotics, and other control interfaces
On-board modules	2765 - mini 2-axis analog-type thumbstick from Adafruit Industries
Key Features	Low power consumption, high quality, high mechanical and electrical durability, self-centering feature, 2-axis, SPI interface, and more
Interface	SPI
Feature	No ClickID
Compatibility	mikroBUS™
Click board size	M (42.9 x 25.4 mm)

Software Support

We provide a library for the Joystick 3 Click as well as a demo application (example), developed using MikroElektronika [compilers](#). The demo can run on all the main MikroElektronika [development boards](#).

Package can be downloaded/installed directly from NECTO Studio Package Manager (recommended way), downloaded from our [LibStock™](#) or found on [Mikroe github account](#).

Library Description

This library contains API for Joystick 3 Click driver.

Key functions

- `joystick3_read_raw_adc` This function reads the raw ADC for X and Y axis by using SPI serial interface.
- `joystick3_get_angle` This function calculates and returns joystick angle in degrees from

Mikroe produces entire development toolchains for all major microcontroller architectures.

ISO 9001: 2015 certification of quality management system (QMS).

raw ADC values for X and Y axis.

- joystick3_get_position This function calculates and returns joystick position flag from raw ADC values for X and Y axis.

Example Description

This example demonstrates the use of the joystick 3 Click board™ by reading and displaying the raw ADC for X and Y axis, as well as the joystick angle and position calculated from those ADC readings.

The full application code, and ready to use projects can be installed directly from NECTO Studio Package Manager(recommended way), downloaded from our [LibStock™](#) or found on [Mikroe github account](#).

Other Mikroe Libraries used in the example:

- MikroSDK.Board
- MikroSDK.Log
- Click.Joystick3

Additional notes and informations

Depending on the development board you are using, you may need [USB UART click](#), [USB UART 2 Click](#) or [RS232 Click](#) to connect to your PC, for development systems with no UART to USB interface available on the board. UART terminal is available in all MikroElektronika [compilers](#).

mikroSDK

This Click board™ is supported with [mikroSDK](#) - MikroElektronika Software Development Kit. To ensure proper operation of mikroSDK compliant Click board™ demo applications, mikroSDK should be downloaded from the [LibStock](#) and installed for the compiler you are using.

For more information about mikroSDK, visit the [official page](#).
